

ABSTRACT

A compact biosensor cartridge in which biosensors can be so set with simple operation that they can be tested one by one and which protects the biosensors from moisture until they are set. A biosensor dispensing device is also disclosed. A biosensor cartridge (6) to be installed in a biosensor dispensing device (1) has therein a pushing member (31) and a pushing rotating member (34) both used as sensor send-out means for sending out the biosensors (10) stacked in a case one by one and ejecting the sensor (10) through a sensor ejecting port (26) opened at the case. With this, the biosensors (10) are discharged to outside the case when the sensor sending out means is driven by a sensor sending out mechanism outside the biosensor cartridge (6). The biosensor cartridge (6) is made small and thinner.
